AMOS Project # Ailixir

Instructions

The project report will be published on our blog. It should be short and sweet, focussed on what you achieved.

“I did not have time to write a short letter, so I wrote a long letter instead.” Attributed to Mark Twain

Being concise is hard work and takes time. Please write as professional a text as you can. Use formal language and correct grammar.

For illustrations please use a persona rather than “test X” or “testperson12”.

Prior examples (not necessarily following our instructions, sadly), can be found here:

Template

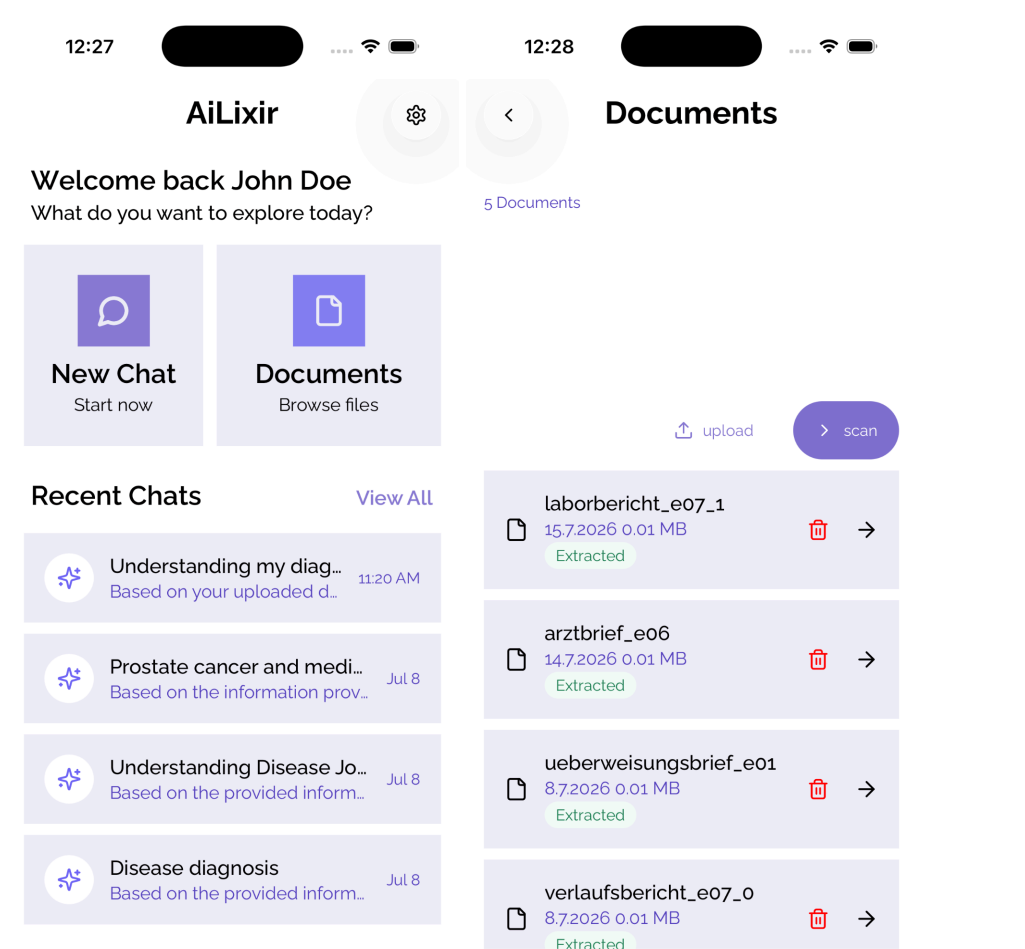

Please use the following template for creating your project report.

Semester	Summer 2026
Project name	Ailixir Intelligence
Project mission	The mission of this project is to create an MVP that runs on mobile devices. Core functionality includes extracting structured information from uploaded documents, storing and organising it within a personal knowledge base, and enabling conversational querying using RAG with optional enrichment from external knowledge sources such as research papers. The system will demonstrate domain configurability using medical documents as the primary domain and finance as a secondary domain.
Industry partner	Andreas Zink
Team logo	
Project summary	Every professional domain relies on documents, yet the knowledge they contain remains fragmented, difficult to interpret, and inaccessible. Medical reports, invoices, contracts, research papers, and many other document types accumulate over time, scattering important information across hundreds of pages and multiple years. Users must manually extract facts, connect them across documents, and interpret domain-specific terminology, making informed decision-making slow, error-prone, and often impossible. While general-purpose AI chatbots can answer questions about

individual documents, they struggle to maintain reliable context across large document collections, frequently losing information or hallucinating when faced with long histories.

Ailixir Intelligence addresses this challenge by transforming unstructured documents into connected, actionable knowledge. Users can upload or scan documents (e.g., medical reports, invoices, contracts), from which the system extracts domain-specific, meaningful data fields and organises them into a personalised, graph-based knowledge base. Rather than treating documents as isolated files, the platform links information across time and across documents, enabling users to understand trends, relationships, and historical context. An AI-powered chat interface allows users to ask precise, context-aware questions grounded in this structured knowledge base instead of raw document text. At its core, the platform is domain-agnostic and configurable, allowing new extraction schemas and knowledge models to be deployed across a wide range of professional use cases.

	12:30 < Understanding my diagnosis What is my diagnosis? Based on your medical records: Your diagnosis is C61 Prostatakarzinom (prostate carcinoma), which was established as of May 3, 2026. This diagnosis is further characterized as: · Niedrigrisiko (low-risk) · Managed with Aktive Überwachung (active surveillance) Key details related to this diagnosis include: · A T-Stadium of cT1c. · A Gleason score of 3+3=6 (ISUP 1). · An elevated PSA level of 7.6 ng/ml. ↻ Reload 📄 Copy Type a message... AI can make mistakes.
